STEINBRUCH CENTER FOR COMPUTING

- 1 Product Environment
 - Software
 - Hardware
- 2 Scenarios
 - Scenario 1
- 3 Use Cases
 - Event Viewer
- 4 System Model
 - Initialization
 - Call a feature

- process and visualize large amounts of scientific data (CERN)
- features a C++ interpreter (CLING) - i.e. used for rapid and efficient prototyping
- persistency mechanism for C++ objects

Scenario 1

Event Viewer

- Expose all
 - Global variables
 - Global functions
 - Classes

- Expose all
 - Global variables
 - Global functions
 - Classes
- Each are bound to corresponding proxy methods
- An object which members are the exposed features is being passed to node

- Expose all
 - Global variables
 - Global functions
 - Classes
- Each are bound to corresponding proxy methods
- An object which members are the exposed features is being passed to node

Names

- Functions and classes have the same name as in Root
- Global variables can be called using `Get[Variable]` and `Set[Variable]` methods

- All features in node are mapped to a proxy method that will be called

- All features in node are mapped to a proxy method that will be called
- The proxy method will eventually call a root function and pass the result to our ObjectFactory

- All features in node are mapped to a proxy method that will be called
- The proxy method will eventually call a root function and pass the result to our ObjectFactory
- By looking at the object type an corresponding v8::Handle will be generated and returned to node
 - If the result is an object this will be done recursively
