STEINBUCH CENTER FOR COMPUTING

About PSE

Praxis der Softwareentwicklung(PSE) = Software Engineering Practice

- Waterfall model
 - Planing/definition
- Functional specification

C. Wolff, M. Früh, S. Rajgopal, C. Haas, J. Schwabe, T. Beffart - rootJS

Purpose

Node.js bindings for ROOT

- be able to write ROOT code in Node.js programs
- integrate ROOT into Node.js based web applications

Required Criteria

The bindings must

- work on Linux
- allow the user to interact with any ROOT class from the Node.js JavaScript interpreter
- accept C++ code for just-in-time compilation
- update dynamically following changes to C++ internals
- provide asynchronous wrappers for common I/O operations (i.e. file and tree access)

Optional Criteria

The bindings should

- support the streaming of data in JavaScript Object Notation (JSON)
 format compatible with JavaScript ROOT
- implement a web server based on Node.js to mimic the function of the ROOT HTTP server
- work OS independent (i.e. support Mac OS X, Linux operating systems)

Data

Limiting criteria

The bindings should not

- add any extending functionality to the existing ROOT framework
- necessarily support previous/future ROOT versions

December 15, 2015

PSE

Product usage

rootJS will be used to create web-applications that can:

- Expose processed data (that might otherwise be hard to access) and then visualize it locally
- Interact with data both stored somewhere accessible for the server or streamed via remote procedure call (RPC)
- Run on any platform that supports a browser

Data

Use Cases

Audience

Most users of rootJS will be used to working in Linux and with web servers. At the very least, they will be able to install ROOT and also be proficient in programming languages like JavaScript and C++.

- Scientists (e.g. particle physicists)
- Researchers
- Web-developers interested in creating applications based on ROOT

Operating conditions

rootJS will be used on servers that run ROOT and have access to the required data sources.

Scenarios

Use Cases

As ROOT 6 currently runs on Linux and OS X only, usage of the bindings is limited to those platforms.

Environment

Data

Interface

Usage

PSE

Purpose

System Model

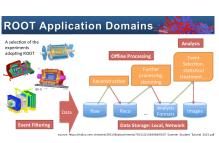

ROOT

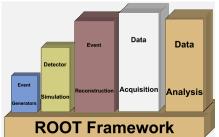

- process and visualize large amounts of scientific data (CERN)
- features a C++ interpreter (CLING) i.e. used for rapid and efficient prototyping
- persistency mechanism for C++ objects

Data

Interface

Environment

Purpose

PSE

Use Cases

Scenarios

Node.js

- open source runtime environment
 - develop server side web applications
 - act as a stand alone web server

December 15, 2015

Node.js

- open source runtime environment
 - develop server side web applications
 - act as a stand alone web server
- Google V8 engine to execute JavaScript code

Node.js

- open source runtime environment
 - develop server side web applications
 - act as a stand alone web server
- Google V8 engine to execute JavaScript code
- rootJS bindings realized as native Node.js module written in C++

PSE

Hardware

- Task: encapsulation of ROOT objects and functions
 - → scanning ROOT structures during initialization
 - → encapsulating objects with heavily nested object structures

Scenarios

Use Cases

→ introduce (proxy) object cache

Interface

Test Cases

Environment

PSE

Purpose

System Model

Hardware

- Task: encapsulation of ROOT objects and functions
 - → scanning ROOT structures during initialization
 - → encapsulating objects with heavily nested object structures
 - → introduce (proxy) object cache

⇒ generally negligible hardware requirements of the bindings themselves

Product data

The following data will be stored by the rootJS bindings

- All ROOT classes and methods as they dynamically mapped to their JavaScript equivalents
- **ROOT** environment state
- Application context is derived from TApplication
- Map of v8::handles 2 identified by the address of ROOT objects

Data

Initialization

- Expose all
 - Global variables
 - Global functions
 - Classes

Statistics

Initialization

- Expose all
 - Global variables
 - Global functions
 - Classes
- Each are bound to corresponding proxy methods
- An object which members are the exposed features is beeing passed to node

Statistics

24/28

Initialization

- Expose all
 - Global variables
 - Global functions
 - Classes
- Each are bound to corresponding proxy methods
- An object which members are the exposed features is beeing passed to node

Names

- Functions and classes have the same name as in Root
- Global variables can be called using Get[Variable] and Set[Variable] methods

Call a feature

All features in node are mapped to a proxy method that will be called

System Model

000000000

Data

Scenarios

Use Cases

PSE

Purpose

Statistics

Call a feature

- All features in node are mapped to a proxy method that will be called
- The proxy method will eventually call a root function and pass the result to our ObjectFactory

Call a feature

- All features in node are mapped to a proxy method that will be called
- The proxy method will eventually call a root function and pass the result to our ObjectFactory
- By looking at the object type an corresponding v8::Handle will be generated and returned to node
 - If the result is an object this will be done recursively
